Declaration

I the undersigned, declare that I am the heavy vehicle specialist inspector identified and I hold a current valid appointment. I certify that the above mentioned vehicle component's design, manufacture and installation, and this certification complies in all respects with the Land Transport Rule: Vehicle Standards Compliance 2002 and my appointment. To the best of my knowledge the information contained in the certificate is true and correct.

This brake calculation report takes into account:

- The legal regulations in the version valid at the time of the brake calculation
- The functional characteristics of the products stored in the program
- The wheel brake data from the available expert opinions of the axle manufacturers
- The vehicle data submitted in writing by the applicant
- A design according to the braking values required in ECE-R13, (EU) 2015/68 or StVZO § 41.

The General Terms and Conditions of delivery apply (see in particular Section 9.0)

Important instructions:

- The applicant/vehicle manufacturer is obliged to verify the actual vehicle data with those of the brake calculation.
- The applicant/vehicle manufacturer must inform ZF of any special requirements of the vehicles produced, according to this brake calculation.
- The applicant/vehicle manufacturer has special requirements that deviate from a standard design, must be informed to ZF.
- The applicant/vehicle manufacturer has an obligatory field-observation and must keep ZF informed in writing of any abnormalities.

Special operating conditions may require modified brake calculation. ZF must be informed accordingly.

Approval countries with specific requirements regarding the required deceleration values require modified brake calculations and must be informed to ZF.

Use with a low axle load and low braking frequency such as the predominant use of tractors with retarders influences the pairing of the coefficient of friction. If the applicant/vehicle manufacturer is aware of such use of the vehicles, ZF must be informed. In the road test, the applicant/vehicle manufacturer must check compliance with the legal regulations using the selected brake calculation and under these special conditions.

Note: Bellow pressure in empty and loaded state must be filled in by manufacturer

Please note: At a control pressure of 6.5 bar, the brake pressure delivered to the brake cylinder is significantly low. In the event of an EBS failure, there is a risk of potential damage to the brakes. (Recommended: greater than 5.5 bar)

As can be seen from the table above, the empty values are for the basic parameter set. Higher empty axle loads and lifting axles are automatically recognized and do not require separate adjustment. The above empty axle loads must not be fallen below.

10 Reference values

The following table shows the reference values for $z = 45.0\%$ for $r_{max} : 421 \text{ mm}$. These reference values are the chamber pressure (p_{cha}) in bar and associated axle braking force (T) in N for each axle. Moreover the table shows the brake cylinder type (service/parking), the maximum stroke (s_{max}) in mm and the lever length (l_{Bh}) in mm. The reference values in the table are used to generate the curve displayed below.

Reference values for $z = 45.0\%$ for $r_{max} : 421 \text{ mm}$
